

VASD TRUST FACTOR ANALYSIS

Trust Authority Infrastructure

Subject: Zoona AI (SparrowDesk Platform, SurveySparrow Inc.)
Domain: sparrowdesk.com
Contact: support@sparrowdesk.com
Response Date: 16 June 2026
Conducted By: VELURYN AGNECY VASD Division
Assessment Date: 18 June 2026

EXECUTIVE SUMMARY

Zoona AI, operating as the artificial intelligence agent within the SparrowDesk customer support platform, was assessed through VASD's three-layer trust verification framework following their acceptance of a case study request and disclosure of internal trust mechanisms. This analysis evaluated the technical, operational, and informational integrity of the entity to determine trustworthiness as a transparency partner. The assessment identified a mature, professionally operated infrastructure with verifiable parent company relationships, legitimate third-party validation, and aligned documentation across independent sources. One minor DMARC cross-domain authorization gap was noted as an administrative matter, not a trust indicator.

Final Classification: TRUSTED | Risk Score: 19/100

METHODOLOGY

VASD Trust Authority Infrastructure operates under a three-layer verification model designed to assess entity trustworthiness through progressively deeper analysis:

Layer 1	Surface Verification	Domain registration history, email authentication protocols (DMARC/SPF/DKIM), registrar legitimacy
Layer 2	Entity Presence	Cross-platform corroboration, real-world footprint, published contact information, third-party validation
Layer 3	Deep Trust Intelligence	Infrastructure analysis, technical configuration consistency, alignment between claimed and observed behavior

Risk scores are calculated on a 0-100 scale, where lower scores indicate higher trust and lower risk. Scores below 30 indicate TRUSTED classification, 30-60 indicate SUSPICIOUS classification, and above 60 indicate HIGH RISK classification.

This assessment was conducted under the Information Technology Act, 2000 (India) framework. All findings represent probabilistic trust assessments based on available information at the time of analysis, not legal determinations or law enforcement conclusions.

LAYER 1: SURFACE VERIFICATION

Domain Registration:

sparrowdesk.com was registered on 3 July 2022, establishing a roughly four-year operational history. This timeframe exceeds the typical throwaway domain pattern observed in fraudulent operations. The registrar, NameCheap Inc., is a widely recognized, legitimate domain registration service with established abuse protocols.

Email Authentication (DMARC):

DMARC record is published with valid syntax and enforcement actively enabled (p=quarantine, sp=quarantine). This configuration demonstrates operational commitment to email security, as it instructs receiving mail servers to quarantine messages that fail authentication checks. The majority of low-effort or malicious domains either omit DMARC entirely or leave enforcement set to 'none' (monitoring only).

Administrative Note:

DMARC aggregate reports are configured to route to dmarc@surveysparrow.com, an external domain. However, the receiving domain (surveysparrow.com) has not published the required external validation authorization record to accept these reports. This represents a minor technical misconfiguration rather than a trust concern. Notably, the cross-domain reporting setup corroborates rather than contradicts the claimed parent company relationship between SparrowDesk and SurveySparrow Inc.

LAYER 2: ENTITY PRESENCE

Third-Party Corroboration:

SparrowDesk and Zoona AI presence is independently verified across multiple external platforms: software review sites, comparison articles, YouTube product reviews, and publicly accessible help center and developer documentation. These sources were not authored or controlled by SparrowDesk, establishing independent validation of the entity's existence and operational legitimacy.

Parent Company Identification:

The entity's about page explicitly identifies SparrowDesk as built and operated by SurveySparrow Inc., a funded company with a publicly known founder. SurveySparrow Inc. maintains a registered San Francisco business address, published phone contact, active social media accounts (X, Instagram, Facebook, LinkedIn, YouTube), and complete legal documentation (Privacy Policy, Terms of Service). This level of transparency and real-world footprint is inconsistent with fraudulent or ephemeral operations.

LAYER 3: DEEP TRUST INTELLIGENCE

Infrastructure Analysis:

Domain name servers operate on AWS Route 53 (ns-149.awsdns-18.com, ns-1514.awsdns-61.org, ns-1766.awsdns-28.co.uk, ns-658.awsdns-18.net), indicating use of professional, enterprise-grade infrastructure rather than throwaway or anonymized hosting. This aligns with the profile of a legitimate, funded SaaS operation.

Cross-Domain Configuration Consistency:

The DMARC cross-domain reporting configuration to surveysparrow.com supports rather than undermines the claimed parent company relationship. While the receiving domain has not published the necessary external validation record (an administrative gap), the configuration itself is consistent with centralized email

security management across a multi-product company structure.

Content Alignment:

The response provided by ZoonA AI regarding trust mechanisms (source citation, escalation rules, knowledge base review workflows, transcript handoff) aligns with content independently documented on SparrowDesk’s help center and marketing materials. This consistency between claimed capabilities and publicly verifiable documentation reinforces operational legitimacy rather than reading as generic deflection or fabricated response.

FINAL VERDICT

Classification:	TRUSTED
Risk Score:	19/100
Risk Factors:	No material risk factors identified
Administrative Note:	DMARC external domain authorization gap (surveysparrow.com) — technical misconfiguration, not a trust indicator

ZoonA AI demonstrates consistent technical, operational, and informational integrity across all three verification layers. The entity maintains professional infrastructure, verifiable parent company relationships, legitimate third-party validation, and alignment between claimed and documented capabilities. The single identified DMARC configuration gap represents a minor administrative matter within a multi-product corporate structure rather than a material trust concern. With a risk score of 19, the entity falls well within the TRUSTED classification threshold.

PUBLIC DISTRIBUTION NOTICE

This trust factor analysis is intended for public distribution and may be shared, referenced, or republished with proper attribution. All assessments are based on publicly available information and disclosed data as of the assessment date. VASD Trust Authority Infrastructure provides probabilistic trust assessments, not guarantees of entity behavior or legal determinations. Recipients should conduct their own due diligence before entering into business relationships. This analysis does not constitute legal, financial, or professional advice.
